Granite — CCP Cheat Sheet

Seoul Accord, 9 characteristics · 8 clear, 1 held-honestly-weak · F26-060

1 Conflicting requirements

PLAIN
Two good things fight each other.

EXAMPLE
Depth vs. speed; a full trace helps diagnosis, but a full trace risks privacy.

SAY
“We can’t max out both at once.”

2 No obvious solution

PLAIN
Top researchers haven’t solved it well.

EXAMPLE
Best published method still wrong 4/10, after 15 months and 7 papers.

SAY
“If it were easy, someone’d be at 95%. Nobody is.”

3 Depth of knowledge

PLAIN
Needs several specialist skills at once.

EXAMPLE
Graph modeling + causal reasoning + AI-evaluation method — combined.

SAY
“Not one skill — three, together.”

4 Unfamiliar issues

PLAIN
Problems you can’t just look up.

EXAMPLE
Same question to the same agent can give two different answers.

SAY
“That breaks how software is normally tested.”

5 Beyond standard practice

PLAIN
No existing tool does this.

EXAMPLE
No framework does attribution + silent-failure detection + repair together.

SAY
“We had to build all three ourselves.”

6 Diverse stakeholders

STILL DEVELOPING

PLAIN
Different people, different needs.

EXAMPLE
Engineer wants the culprit; product team wants ship/no-ship; auditor wants proof.

SAY
“We just haven’t talked to real ones yet.”

7 Significant consequences

PLAIN
If it’s wrong, it actually matters.

EXAMPLE
Agents already run support & write code — a silent failure ships undetected.

SAY
“Not hypothetical — already in production.”

8 Interdependence

PLAIN
One part’s mistake spreads to the rest.

EXAMPLE
Agent 1’s small error feeds into Agent 2, then Agent 3’s work.

SAY
“One mistake becomes every downstream agent’s problem.”

9 Ill-defined cause

PLAIN
You don’t know what you’re looking for yet.

EXAMPLE
Don’t know IF it failed, WHICH agent, or WHAT was correct.

SAY
“Three unknowns, stacked at once.”
